

1. List all the main components you find inside a desktop PC after opening the cabinet, and write a short description (1-2 lines) for each.

Main Components inside Cabinet of desktop PC

1. Motherboard

The main circuit board that connects and allows communication between all computer components.

2. CPU (Central Processing Unit)

The brain of the computer that performs calculations and executes instructions.

3. CPU Cooler (Heatsink and Fan)

Removes heat generated by the CPU to prevent overheating.

4. RAM (Random Access Memory)

Temporary high-speed memory used by programs and the operating system while running.

5. Power Supply Unit (PSU)

Converts AC power from the wall into DC power required by computer components.

6. Storage Device (SSD/HDD)

Stores the operating system, applications, and user files permanently.

7. Graphic Card (GPU)

Processes graphics and video output; essential for gaming, design, and AI workloads.

8. Power Cables

Carry electrical power from the PSU to the motherboard, drives, and other components.

9. Data Cables (SATA, etc.)

Transfer data between storage devices and the motherboard.

2. Take clear photos or draw labeled diagrams of each step as you disassemble a desktop PC, and organize them in a document with captions explaining what you did at each step.

3. Reassemble the PC you disassembled, documenting each step with a brief explanation of what you connected or installed and why the order matters.

4. Create a checklist of safety precautions and tools needed before starting the PC assembly/disassembly process, and explain why each is important.
